

Salesforce Admin — Build Sheet (one page)

Everything the Salesforce admin needs to do to enable the Case → FreeWheel automation. The tool is built and running; this is the only Salesforce-side work.

A. Create fields on the Case object

Import from `docs/salesforce-case-fields.csv` (API names, types, picklist values, help text — generated from live config). Start with the **7 required**; the rest can follow.

Minimal (7 — do these first): | Field Label | API Name | Type | Picklist | |---|---|---|---| | Promoted Title | `Promoted_Title__c` | Text (120) | — | | Region | `Region__c` | Picklist | USA, CA, AU, LATAM, BR, UK, IE, FR, IT, GSA, FI, DK, NO, SE, ES | | Language | `Language__c` | Picklist | English, French | | Campaign Name | `Campaign_Name__c` | Picklist | 153 values (in CSV) | | Flight Start | `Flight_Start__c` | Date | — | | Flight End | `Flight_End__c` | Date | — | | Video Durations | `Video_Durations__c` | Text (50) | e.g. 30;15 |

Then (30 more): 12 optional creative/product selectors (incl. the 2 Exclude fields), 10 Yes/No product toggles, 8 auto-derived override fields — all in the CSV.

B. Add picklist values (to existing Status/Reason fields — not new fields)

Field	Value
Status	<code>Ready for Automation</code>
Status	<code>Needs Info</code>
Reason	<code>Submitted to FreeWheel</code>

B2. Add a "Campaign Setup Form" Record Type (or checkbox)

So the automation knows which Cases are promo-setup requests. The Record Type scopes *which* Cases we process; Status = "Ready for Automation" says *when* to run.

B3. Targeting + exclude fields are pre-defined (no free text)

Genre/Category/Daypart = picklists; Showlist, Pluto Channels, Audience Segments, and the two **Exclude** fields (`Exclude_Series__c` , `Exclude_Channels__c`) = **lookups** to objects we sync from FreeWheel (type-to-search, only real records). Value sources + refresh: `templates/targeting-options/` .

C. Access for the integration

- A **sandbox** to build/test in.
- A **Connected App** or integration user (username + password + security token) that can: read Cases + these fields, and write Status/Reason + add a Case comment.

D. Confirm

- We can **attach and read a "Targeting" sheet** on a Case (holds the variable-length targeting lists: showlist, genres, Pluto channels/categories).
- Any **API-name conventions** to follow — if so, tell us and we map them on our side (one file), no rework for you.

Acceptance check (how we know it's done)

We run `promo-ops salesforce-check` — it logs in and reports any missing field or picklist value. **Green = ready**. That's the single go/no-go signal.

Fields regenerate from config any time with `python scripts/build_salesforce_fields.py` → `docs/salesforce-case-fields.csv` . Full detail + rationale in `docs/SALESFORCE_FIELD_MAPPING.md` .
