

Salesforce → FreeWheel Automation — Field Mapping

Purpose: what needs to be built on the Salesforce **Case** object so a planner can fill out a Case, flag it, and the automation creates the FreeWheel draft Order + Placements automatically. This is the up-to-date spec (generated from the live config — 153 campaigns across 15 regions).

Companion file: `docs/salesforce-case-fields.csv` — the same 35 fields as an import-ready sheet for the SF admin (Object, Section, API Name, Data Type, Picklist Values, Required, Help Text).

1. How it works (the flow)

Key point for the discussion: **Salesforce is only the intake form.** All the ad-ops logic (tiering, naming, ad units, geo, exclusions, per-brand products) already lives in the tool and is unit-tested. SF's only job is to capture ~7 required fields cleanly and hold a status flag. We are **not** asking SF to compute anything.

2. The minimal path (build these 7 first)

If we do nothing else, these 7 fields let the automation build a standard order. Every other field is optional polish or an override.

Field Label	API Name	Type	Picklist
Promoted Title	Promoted_Title__c	Text	—
Region	Region__c	Picklist	USA, CA, AU, LATAM, BR, UK, IE, FR, IT, GSA, FI, DK, NO, SE, ES
Language	Language__c	Picklist	English, French (<i>routes Canada to FR vs EN</i>)
Campaign Name	Campaign_Name__c	Picklist	the 153 FreeWheel campaigns (<i>drives Brand/Advertiser/default products</i>)
Flight Start	Flight_Start__c	Date	—
Flight End	Flight_End__c	Date	—
Video Durations	Video_Durations__c	Text	e.g. 30;15 (semicolon-separated)

Everything derives from **Campaign Name** — pick the campaign and the brand, advertiser, default product set, ad units, geo, and naming all resolve automatically.

3. Full field list (35 fields)

Grouped by section. **Required** = planner must fill; everything else defaults or is an override that's normally left blank. Product toggles are Yes / No / (blank) , where blank = "use the brand's standard set."

Required (7)

Field	API Name	Type
Promoted Title	Promoted_Title__c	Text
Region	Region__c	Picklist
Language	Language__c	Picklist (English; French)
Campaign Name	Campaign_Name__c	Picklist
Flight Start	Flight_Start__c	Date
Flight End	Flight_End__c	Date
Video Durations	Video_Durations__c	Text

Optional creative / product selectors (10)

Field	API Name	Type	Values
Season or Messaging	Season_or_Messaging__c	Text	middle of the placement name
Content Type	Content_Type__c	Picklist	show; movie
Content ID	Content_ID__c	Text	ShowID / MovieID
Recommended Show ID	Recommended_Show_ID__c	Text	defaults to Content ID
Flight Code	Flight_Code__c	Text	launch beat
Kids Audience	Kids_Audience__c	Multi-Select	older; younger (<i>Kids brands</i>)
Rating Restrictions	Rating_Restrictions__c	Long Text	(<i>AU Network 10 only</i>)
Video Domination	Video_Domination__c	Picklist	pluto; standard; aus_10_streaming; uk_my5
Video Domination Targeting	Video_Domination_Targeting__c	Long Text	Pluto categories (<i>Pluto VD only</i>)
Takeover	Takeover__c	Picklist	hpto; first_impression; arena_takeover; three_peat
Series to Exclude	Exclude_Series__c	Lookup / Multi-Select	keep the promo OUT of these series on every placement
Pluto Channels to Exclude	Exclude_Channels__c	Lookup / Multi-Select	keep the promo OUT of these channels (Region-scoped)

Products — Yes / No toggles (10) (*blank = brand default*)

Include_Remnant_Video__c , Include_Pause_Ads__c , Include_Premium_Pre_Roll__c , Include_Essential_Bumper__c , Include_CBS_Pre_Roll__c , Include_After_Mid_Roll_Bumper__c , Include_1Z_Lockdown__c , Include_2Z_Lockdown__c , Include_Pluto__c (*UK P+ only*), Include_Network_10__c (*AU only*) — all Picklist Yes; No .

Overrides — auto-derived, set only if needed (8)

Brand__c , Advertiser__c , Advertiser_ID__c , Campaign_ID__c , Insertion_Order_Name__c , Recommended_Show__c , Exclude_Show__c , Formats__c . These normally stay blank; they exist as escape hatches when the auto-derivation needs a manual nudge.

4. Status / Reason picklist values (add to existing fields)

These are **not new fields** — they're picklist *values* the automation reads/writes on the Case's existing Status/Reason fields.

Field	Value	Who sets it
Status	Ready for Automation	Planner — this is the trigger
Status	Needs Info	Automation, when a Case can't be built (+ comment)
Reason	Submitted to FreeWheel	Automation, after the draft IO is created (+ IO link)

Trigger / Record Type (recommended). So the automation reliably knows *which* Cases are promo-setup requests, add a **Record Type "Campaign Setup Form"** (or a checkbox `Campaign_Setup_Form__c`). That scopes which Cases we process (the layout + these fields); **Status = "Ready for Automation"** then says *when* to run. The poller filters on both.

4b. Targeting values are pre-defined — no free text

Every targeting field draws from canonical lists generated from FreeWheel (see `templates/targeting-options/`), so a planner can only pick real values:

Field	SF control	Source
Genre (+ Franchise + Daypart)	Multi-select picklist	<code>genres.csv</code>
Pluto Categories	Region-dependent picklist	<code>pluto-categories-by-region.csv</code>
Pluto Channels	Lookup / type-to-search (Region-scoped)	<code>pluto-channels-by-region.csv</code>
Audience Segments	Lookup / type-to-search (refreshed daily)	<code>audience-segments.csv</code>
Showlist / Series to Exclude	Lookup / type-to-search	<code>shows.csv</code> (~188k FW series)
Pluto Channels to Exclude	Lookup / type-to-search (Region-scoped)	<code>pluto-channels-by-region.csv</code>

Small finite lists = picklists; large lists (Showlist, Channels, Audience, the two Exclude fields) = **lookups to synced objects** — type-to-search, only real records, no typos. Refreshed on the daily sync. Full guidance: `templates/targeting-options/README.md`.

5. The attached "Targeting" sheet (7 columns)

Detailed targeting lists are captured on a standard **Targeting** sheet attached to the Case (not as Case fields — they're variable-length lists). The automation reads these columns:

Audience Segments (Tier 1), Kids Audience , Networks , Genres , Showlist , Pluto Categories , Pluto Channels .

Most of these auto-resolve (e.g. Tier-1 audience segments derive from the Showlist), so the planner usually only fills Showlist + a couple of genre/category lists.

6. What we need from the Salesforce admin

1. Create the **37 Case fields** above (CSV is import-ready). Or start with just the **7 required** to prove the loop, and add the rest incrementally.
2. Add the **3 Status/Reason picklist values** in §4, and a **"Campaign Setup Form" Record Type (or checkbox)** so the automation knows which Cases are ours.
3. Confirm the API user + permissions the automation will authenticate as (read Case + fields, write Status/Reason + comments).
4. Confirm we can attach / read the **Targeting** sheet on a Case (or whether targeting should instead be additional Case fields — see open question below).

Once those exist, `promo-ops salesforce-check` logs in and reports any missing field or picklist value, so we get a green/red readiness check before running a real Case.

7. Open questions to decide together

- **Targeting sheet vs. fields** — keep detailed targeting on an attached sheet (flexible, variable-length) or model a few as Case fields? Recommend: attached sheet, since lists vary in length and the planner form already handles it.
 - **Picklist upkeep** — Campaign Name (153 values) and Brand change as we add markets. We can regenerate the picklist from config on demand; decide whether the admin pastes the refreshed list or we wire an automated sync later.
 - **Trigger mechanism** — a Status value ("Ready for Automation") is simplest. If the team prefers a checkbox or a specific Record Type/queue, that's an easy swap.
 - **Scope for phase 1** — which regions/brands go live first? The tool supports all 15 regions today, but we can pilot with one (e.g. USA) to validate the loop before opening it up.
-

Generated from the live config. Regenerate the field list any time with `python -c "from promo_ops.integrations.salesforce import build_case_field_rows" → docs/salesforce-case-fields.csv`.
