

Team demo — script + ask

A tight script to show what the tool does today and align on the Salesforce build. Everything below runs against **FreeWheel production, 15 regions, 153 campaigns** (full parity with what's live in FreeWheel). Goal of the meeting: get the admin to **create the Case fields + a sandbox/Connected App** so we can flip the switch on automated intake.

1. The one-line pitch

"A planner fills out a simple form; the tool builds the FreeWheel Insertion Order + every placement — correct tiering, naming, ad units, geo, and exclusions — as a draft, and can duplicate a title across markets in one click. It's running against FreeWheel production for 15 regions today. The last mile is wiring the intake to Salesforce."

2. Demo A — the interactive intake form (what planners touch)

Open `templates/campaign-plan/campaign-plan-form.html` in any browser (no login, no install). Walk through: - Pick **Region** → **Campaign** — brand, advertiser, and the products that campaign runs fill in automatically. Conditional fields appear only when relevant (Language for CA, Kids Audience for kids brands, Rating Restrictions for AU Network 10). - Real dropdowns + chip inputs — hard to enter anything invalid. Every one of the 153 campaigns is selectable, per country. - Click **Download plan file** → a JSON the tool consumes directly.

Talking point: this replaced the "clunky spreadsheet." It's the same intake a Salesforce Case will capture — so the form doubles as the spec for the SF fields.

3. Demo B — form/Case → FreeWheel order (the automation)

Show the exact transform a real Case will drive, from a local Case file:

```
promo-ops from-case-file examples/case-frisco-king-usa.json \  
--targeting templates/campaign-plan/Targeting.csv
```

→ builds **14 placements** (remnant Tiers 1–4 × durations, Pause Ads, Premium Pre-Roll + Essential Bumper) from ~10 Case fields + the attached Targeting sheet. Talking points: - The

Case has ~10 fields; **everything else is derived** from the Campaign (brand, advertiser, formats, all targeting + exclusion rules). - Add `--live` to create the NOT_BOOKED draft in FreeWheel. Then show a **real production draft** already created by the tool (any `[QA TEST]` IO) so they see it end-to-end.

4. Demo C — duplicate a title to other markets (the time-saver)

Same title, many countries — one action instead of rebuilding each by hand:

```
promo-ops mirror frisco-king-fr.plan.json --to GSA,IT,ES
```

→ writes a ready plan for each market, re-pointed at that country's equivalent brand, with naming, ad units, geo, and placements re-derived. Markets with no equivalent brand are skipped with a reason (never guessed). Same feature is in the form as **"Duplicate to another market."**

5. What the Case looks like

- Open `examples/case-frisco-king-usa.json` (the "form") and `docs/SALESFORCE_EXAMPLE_CASE.md` (the same, annotated: what the planner fills vs. what the automation derives).
- The hand-off is one flag: **Status = "Ready for Automation."**

6. The ask (hand these over)

- `docs/SALESFORCE_FIELD_MAPPING.md` (+ PDF) — the field mapping: the minimal 7-field path, the full 35-field spec, the Status/Reason values, and the open questions.
- `docs/salesforce-case-fields.csv` — the exact fields to create (API names, types, picklist values for all 15 regions / 153 campaigns). Generated from live config, so it's complete and current.
- `docs/SALESFORCE_GOLIVE.md` — the go-live runbook (fields → creds → preflight → schedule).
- Concretely we need: the custom fields created, the **Status/Reason** picklist values, a **sandbox + Connected App** (or integration user), and confirmation of the Case layout. Offer to rename API names to their conventions.

7. What happens right after they say yes

```
promo-ops salesforce-check          # proves creds + that every field/picklist exists
promo-ops from-case <CASE_ID>      # dry-run one real Case (no writes)
promo-ops from-case <CASE_ID> --live # create the draft + comment back
promo-ops poll-cases --live --watch  # unattended: process every Ready Case on an interval
```

`salesforce-check` turns green when the org is built — that's the go/no-go signal. Suggest piloting **one region (e.g. USA)** first to prove the loop, then open up all 15.

8. If asked "what's NOT automated yet"

- **Operative takeovers / Video Dominations** book through Operative's UI (no API); the tool prints a step-by-step booking worksheet (`promo-ops booking-sheet`). GAM is ready to wire (`gam-check`) if/when API access is granted.
- Go-live is human-in-the-loop by design — drafts are created NOT_BOOKED; a person reviews and activates in FreeWheel.

9. Proof points (numbers to cite)

- **15 regions, 153 campaigns** — full parity with FreeWheel (every brand-campaign that exists under the advertisers is selectable).
- **180 automated tests** covering tiering, naming, ad units, geo, every exclusion rule, the add-ons, mirroring, and the automation loop — all runnable with no credentials.
- Reverse-engineered and verified against live reference IOs; site-groups confirmed against production.
